Use the API

Here is an example taken from the ppp program. I expect this to be the format that will work.

```
#1/bin/sh
symbol=$( cat symbol.json )
body="{\"apAmountA\":$2,\"apAmountB\":$4,\"apCoinB\":{\"unAssetClass\":[$symbol,{\"unTokenNassetClass\":[$symbol,{\"unTokenNassetClass\":[$symbol,{\"unTokenNassetClass\":[$symbol,{\"unTokenNassetClass\":[$symbol,{\"unTokenNassetClass\":[$symbol,{\"unTokenNassetClass\":[$symbol,{\"unTokenNassetClass\":[$symbol,{\"unTokenNassetClass\":[$symbol,{\"unTokenNassetClass\":[$symbol,{\"unTokenNassetClass\":[$symbol,{\"unTokenNassetClass\":[$symbol,{\"unTokenNassetClass\":[$symbol,{\"unTokenNassetClass\":[$symbol,{\"unTokenNassetClass\":[$symbol,{\"unTokenNassetClass\":[$symbol,{\"unTokenNassetClass\":[$symbol,{\"unTokenNassetClass\":[$symbol,{\"unTokenNassetClass\":[$symbol,{\"unTokenNassetClass\":[$symbol,{\"unTokenNassetClass\":[$symbol,{\"unTokenNassetClass\":[$symbol,{\"unTokenNassetClass\":[$symbol,{\"unTokenNassetClass\":[$symbol,{\"unTokenNassetClass\":[$symbol,{\"unTokenNassetClass\":[$symbol,{\"unTokenNassetClass\":[$symbol,{\"unTokenNassetClass\":[$symbol,{\"unTokenNassetClass\":[$symbol,{\"unTokenNassetClass\":[$symbol,{\"unTokenNassetClass\":[$symbol,{\"unTokenNassetClass\":[$symbol,{\"unTokenNassetClass\":[$symbol,{\"unTokenNassetClass\":[$symbol,{\"unTokenNassetClass\":[$symbol,{\"unTokenNassetClass\":[$symbol,{\"unTokenNassetClass\":[$symbol,{\"unTokenNassetClass\":[$symbol,{\"unTokenNassetClass\":[$symbol,{\"unTokenNassetClass\":[$symbol,{\"unTokenNassetClass\":[$symbol,{\"unTokenNassetClass\":[$symbol,{\"unTokenNassetClass\":[$symbol,{\"unTokenNassetClass\":[$symbol,{\"unTokenNassetClass\":[$symbol,{\"unTokenNassetClass\":[$symbol,{\"unTokenNassetClass\":[$symbol,{\"unTokenNassetClass\":[$symbol,{\"unTokenNassetClass\":[$symbol,{\"unTokenNassetClass\":[$symbol,{\"unTokenNassetClass\":[$symbol,{\"unTokenNassetClass\":[$symbol,{\"unTokenNassetClass\":[$symbol,{\"unTokenNassetClass\":[$symbol,{\"unTokenNassetClass\":[$symbol,{\"unTokenNassetClass\":[$symbol,{\"unTokenNassetClass\":[$symbol,{\"unTokenNassetClass\":[$symbol,{\"unTokenNassetClass\":[$symbol,{\"unTokenNassetClass\":[$symbol,{\"unTokenNassetCla
echo $body
curl "http://localhost:9080/api/contract/instance/$(cat W$1.cid)/endpoint/add" \
--header 'Content-Type: application/json' \

bash $ curl -vX POST http://localhost:8090/v2/wallets/617963656a409b8a6828dc3a09001de22af904
             -H "Accept: application/json; charset=utf-8" \
"Content-Type: application/json; charset=utf-8" \
                                                                                                                            -d '{
"payments": [
                                         {
                                                       "address": "addr1qryq74hega5juqd19n86697mwx0mfxu5hf02vuphnqfejtj3rk
"amount": { "quantity": 1000000, "unit": "lovelace" }
           "metadata":{ "4": { "map": [ { "k": { "string": "key" },
"v": { "string": "value" } }, { "k": { "string": "14" }, "v": {
"int": 42 } } ] } },
                                                       "passphrase": "Secure Passphrase"
For the implementation as a webpage, we can use Fetch. Here is an example.
var url = 'https://www.googleapis.com/geolocation/v1/geolocate?key=YOUR_KEY';
```

```
var data = {some: json};
  fetch(url, {
    body: JSON.stringify(data),
    headers: {
      'dataType': 'json',
      'content-type': 'application/json'
    },
    method: 'POST',
    redirect: 'follow'
 })
  .then(response => {
    if (response.status === 200) {
      console.log(response.text());
   throw new Error('Something went wrong on api server!');
})
.catch(error => {
  console.error(error);
});
To find out more, use Mozilla. Here is a simple example.
fetch('http://example.com/movies.json')
  .then(response => response.json())
  .then(data => console.log(data));
Here is a much more complex example with notes.
// Example POST method implementation:
async function postData(url = '', data = {}) {
  // Default options are marked with *
  const response = await fetch(url, {
    method: 'POST', // *GET, POST, PUT, DELETE, etc.
    mode: 'cors', // no-cors, *cors, same-origin
    cache: 'no-cache', // *default, no-cache, reload, force-cache, only-if-cached
    credentials: 'same-origin', // include, *same-origin, omit
    headers: {
      'Content-Type': 'application/json'
      // 'Content-Type': 'application/x-www-form-urlencoded',
    },
    redirect: 'follow', // manual, *follow, error
    referrerPolicy: 'no-referrer', // no-referrer, *no-referrer-when-downgrade, origin, origin,
    body: JSON.stringify(data) // body data type must match "Content-Type" header
 return response.json(); // parses JSON response into native JavaScript objects
}
```

```
postData('https://example.com/answer', { answer: 42 })
  .then(data => {
    console.log(data); // JSON data parsed by `data.json()` call
 });
Don't forget your credentials!
fetch('https://example.com', {
  credentials: 'include'
});
// The calling script is on the origin 'https://example.com'
fetch('https://example.com', {
 credentials: 'same-origin'
});
fetch('https://example.com', {
  credentials: 'omit'
})
What about JSON again?
const data = { username: 'example' };
fetch('https://example.com/profile', {
 method: 'POST', // or 'PUT'
 headers: {
    'Content-Type': 'application/json',
 body: JSON.stringify(data),
.then(response => response.json())
.then(data => {
  console.log('Success:', data);
.catch((error) => {
  console.error('Error:', error);
});
What do I do when I need to submit a transaction?
const formData = new FormData();
const fileField = document.querySelector('input[type="file"]');
formData.append('username', 'abc123');
formData.append('avatar', fileField.files[0]);
fetch('https://example.com/profile/avatar', {
```

```
method: 'PUT',
  body: formData
})
.then(response => response.json())
.then(result => {
  console.log('Success:', result);
})
.catch(error => {
  console.error('Error:', error);
});
```
